## ***SERVICE MANUAL- M128***

### ***MODEL #S-11 MANUAL CAN OPENER***

## **Model S-11 Can Opener Assembly Procedure**

The Model S-11 can opener will be assembled according to the following procedure:

### I. **Model S-11 Handle and Arbor Assembly** (A942) (Fig. 1 and Fig. 2)

Insert arbor (A050) into slot at end of handle assembly (A943). Align holes and secure by pressing knurled pin (P026) flush with side of handle assembly.

### II. **Model S-11 Knife holder Assembly** (A941) Fig. #1 and Fig. #2

Slide the S-11 "O" seal (R085) over the knife retaining screw (S276) until the seal is against the knurled screw head. Place the knife (K032) against the front of the tang of the knife holder, H063, align the holes and secure in place using the knife retaining screw (S276). End of knife must slide under the slot at the top of the tang.

### III. **Model S-11 Main Assembly** Fig. 1 and Fig. 2

Place the spring (S275) down inside top hole in the slide bar assembly (A941/A941L). Place the spool (S274) on top of the spring and slide the gear (G030) into the gear slot of the slide bar. Slide the arbor of the handle and arbor assembly (A942) down through the spool and the spring and thread gear onto the end of the arbor by retaining the gear and turning the handle and arbor assembly clockwise when viewed from the top of the handle.

Lift the handle and slide the ears of the knife holder assembly (A946) into space between the flanges of the spool. Align the hole in the knife holder with the holes in the slide bar and secure using pull pin (P169).

Inspect using test instructions EC1067A.

### IV. **Can Opener Maintenance**

1. **Knife Replacement Procedure** -The knife (K032) must be checked periodically to make sure that there aren't any nicks or visible wear on the edge. When a nick or groove can be felt with the fingernail, the knife should be reversed to use the unused edge or it should be replaced.

To reverse the knife, raise the handle and remove the pull pin (P169). Remove the knife holder assembly (A946). Remove the knife retaining screw (S276) and turn the knife over and retain with the knife retaining screw. Place knife holder assembly back into slot in spool, align holes and insert pin (P169). The can opener is now ready for operation.

"O" seal should be replaced each time the knife is replaced. A new seal is included with each knife.

2. **Gear Replacement Procedure** - Gear should be replaced when it will no longer turn a can or the gear starts to remove metal from the bead of the can. To remove the gear, place a soft screw or nail on the right side of the gear between the gear and the edge of the gear slot, to hold the gear, and turn handle and arbor assembly counter clockwise. Remove gear and clear gear slot of all food and can residue.

Place the new gear (G030) into the gear slot with stamped words "Edlund Up" toward top of slide bar. Slide arbor down through the spool and spring and thread gear onto the end of the arbor by retaining the gear and turning the handle and arbor clockwise looking down onto handle.

3. **Spool Replacement** - If knife doesn't rotate far enough away from the drive gear to allow the knife to penetrate the can lid when the can opener is used, then the spool may need to be replaced.

To replace the spool, raise the handle and remove the knife holder assembly as in knife replacement procedure. Remove the handle and arbor assembly as in the gear replacement procedure, replace the worn spool with a new one and reassemble the can opener.

If there is any questions about proper operation of this can opener, inspect using test instruction EC1067A.

**Model #S-11 NSF Certified Manual Can Opener Care and Maintenance Procedures**

The Edlund Model S-11 NSF certified manual can opener, holding patent #, must receive proper care and maintenance in order to function properly and to prevent unsafe conditions over the life of the product or the life of any of its components. To obtain the maximum life of the product, follow the care and maintenance procedures below:

**Cleaning Procedure:** The can opener should be cleaned daily or after each extended use. The S-11 is manufactured almost entirely of cast stainless steel and is dishwasher safe for easy cleaning. Follow the procedures below:

A. Raise the can opener handle; remove the stainless steel pull pin and the knife holder assembly. Remove all food and can particles from the knife holder, knife, drive gear and knife stop assembly using the stainless steel cleaning brush, Edlund Model # ST-93. Regular use of this tool will make dishwashing or cleaning the unit easier.

B. Remove the knife from the knife holder by unscrewing the knurled screw. Clean as necessary to remove any food residue from the knife, knife holder or knurled screw using soap and water. Clean the can opener slide bar and handle assembly using the stainless steel brush. All parts may be placed in a dishwasher or pot sink for final cleaning.

The drive gear should be disassembled from the can opener weekly and the parts thoroughly cleaned using the cleaning brush. These parts should then be placed in the dishwasher or pot sink for a final wash cycle.

C. If product buildup becomes too heavily caked for easy cleaning, use the following procedure. If a dishwasher is not available, remove the knife from the knife holder and wash as in step "B". Dry thoroughly using a cloth or paper towel. Place the can opener in the base and remove the drive gear by placing a nail, flathead screw driver or soft metal object in the right hand space between the gear and the edge of the gear cavity to prevent gear rotation. Unscrew the handle and arbor assembly from the drive gear by turning the handle counter-clockwise until the handle and arbor are free. Remove the gear spring, spool and handle and arbor assembly from the can opener housing and clean off all food and can particles from all parts using the cleaning brush. Wash all the parts using soap and water and thoroughly dry by using a cloth or paper towel.

Reassemble the can opener by placing slide bar in the base; place the gear in the gear slot with the word "up" toward the top of the can opener. Insert the spring and spool into the spring cavity and insert the handle and arbor assembly through the spool and spring and into the threaded hole of the drive gear. Tighten by placing a nail or soft metal object in the left hand space between the drive gear and the edge of the gear slot. Turn the handle and arbor assembly clockwise until the assembly is tight. Place the knife on the knife holder and align the hole in the knife holder with the threaded hole in the knife. Insert the knurled screw through the hole in the knife holder and tighten the knurled screw.

Lift the handle of the handle and arbor assembly and insert the knife holder assembly into the can opener and into the space in the spool. Align the hole in the knife holder with the holes in the can opener housing and insert the pull pin. The can opener is now ready for operation.

D. The base assembly should be removed at least weekly from the worktable by unscrewing the clamp if it is a clamp base or the three screws and wing nuts if it is a screw-on base and cleaned using the cleaning brush. Wash with soap and water or in the dishwasher and thoroughly dry. Reassemble to the worktable by tightening the clamp or the three screws and wing nuts.

**ii. Maintenance Procedure** Periodically perform maintenance as follows:

A. Check for wear of the shear blade or knife by running a fingernail over the cutting edge to make sure a sharp groove has not formed. A groove in the blade can cause metal slivers. If a groove is found turn the knife over to use the unused cutting edge or replace the blade with a new one. This check can be done each time the can opener is cleaned.

B. The drive gear should be inspected for wear monthly by first opening a dent free #10 can with the opener. Inspect the can bead to see if the lines left by the drive gear are narrow and evenly spaced or if they are wide. Wide grooves indicate that the gear is slipping and removing metal from the can bead. If the gear is removing metal from the can bead or "milling," inspect the gear for wear.

If the teeth are dull, replace the drive gear using the procedure listed in Section 1C.

If the gear teeth appear to be sharp, check the bearing hole of the bushing located below the drive gear by turning the opener upside down and determining if the hole is elongated. If the hole is elongated, remove the drive gear using the method previously described and drive out the bronze bushing and replace this bushing. Reassemble the opener for use, using the method previously described.

C. To prevent premature wear of the bronze-bushing place a small amount of non-sticking vegetable oil into the bushing each time the can opener is cleaned.

D. The can opener and base should be inspected weekly for any excessive wear to the base slot or any part of the can opener. If any excessive wear affects the operation of the can opener, replace those parts or assemblies.

Please note: The Edlund Model S-11 can opener holds two patents and is designed to provide many years of trouble free use. All S-11 parts are repairable and replaceable. We are so confident in this product that we offer a full 5-year warranty against manufacturing defects.

**Model S-11 Can Opener**  
**Trouble Shooting Guide**

<b>Problem</b>	<b>Cause</b>	<b>Correction</b>
I. Can opener will not turn can.	1. Drive gear is worn.	1. Replace gear (G030).
	2. Drive gear needs cleaning.	2. Clean drive gear (G030) and gear slot using cleaning tool (ST-93).
	3. Bushing (B173) in slide bar or arbor (A050) is worn allowing gear to move out of contact with the can bead.	3. Inspect arbor and bushing and replace as necessary.
II. Knife will not lift far enough from gear to pierce can when handle is lifted.	1. Worn spool (B274).	1. Replace spool.
III. Metal slivers found in food product.	1. Nick or groove worn on cutting edge of knife (K032).	1. Reverse knife or replace if it has been reversed already.
	2. Worn drive gear (G030).	2. Replace drive gear.
	3. Sharp edge on knife stop.	3. Round edge using file or replace slide bar.
IV. Can opener keeps withdrawing from the can during can opening operations.	1. Worn or loose slide bar.	1. Replace base.
	2. Can opener used in base or preparation table that doesn't have two-degree angle on bar holder.	2. Replace base or repair hole in preparation table to include two-degree angle to bar holder.
